VULNERABILITY MANAGEMENT

STOP ATTACKS BEFORE THEY START: PROACTIVE DEFENSE, SEAMLESSLY INTEGRATED.

Proactive Endpoint Risk Reduction

The Cybereason Vulnerability Management add-on is a powerful new capability, seamlessly integrated into your existing Cybereason Defense Platform. It transforms your endpoint security from purely reactive threat detection to proactive risk reduction. By continuously assessing applications on your endpoints, it identifies known software weaknesses (CVEs) and delivers precise, actionable recommendations for patching. This means you gain critical foresight, understanding your weaknesses and eliminating common entry points before attackers can exploit them.

UNIFYING PREVENTION & DETECTION

While Cybereason's core platform excels at detecting and ending active attacks, this add-on provides the critical foresight to prevent attacks by eliminating common entry points. Here's why it's a game-changer:

INTEGRATED WORKFLOW

Unlike standalone vulnerability scanners, it's built directly into your Cybereason EPP, leveraging the same lightweight agent and console. This eliminates tool sprawl and simplifies operations.

PROACTIVE RISK REDUCTION

Shifts your security focus from solely reacting to attacks to actively identifying and mitigating weaknesses attackers commonly exploit.

ACTIONABLE INTELLIGENCE

Delivers clear, prioritized patch recommendations (exactly what to update and to which version), moving beyond just lists of CVEs.

COMPREHENSIVE UNIFIED VIEW

Combines real-time threat detection with continuous vulnerability assessment, giving you a holistic understanding of your endpoint risk posture in a single pane of glass.

EFFICIENT & AUTOMATED:

Automated assessments and reporting streamline vulnerability management, reducing manual overhead. It leverages a robust, continuously updated vulnerability intelligence database for comprehensive and current insights.

GO FURTHER

COMPREHENSIVE VULNERABILITY MANAGEMENT

- Continuously scans and assesses all installed applications on your endpoints for known Common Vulnerabilities and Exposures (CVEs). Providing clear details on each weakness.

- Delivers prioritized guidance on which patches to apply to specific software versions, simplifying remediation.

- Identify vulnerabilities on devices at rest, in binaries and installers before they are installed, preventing zero-day threats.

- Consolidates vulnerability data directly within your Cybereason Defense Platform console, alongside threat detections for a single pane of glass

- Ensures that as new applications are installed or existing ones are updated, their vulnerability status is continuously assessed and reported.

- Provides comprehensive, easy-to-understand reports on vulnerability status across your entire endpoint fleet for compliance and risk management.
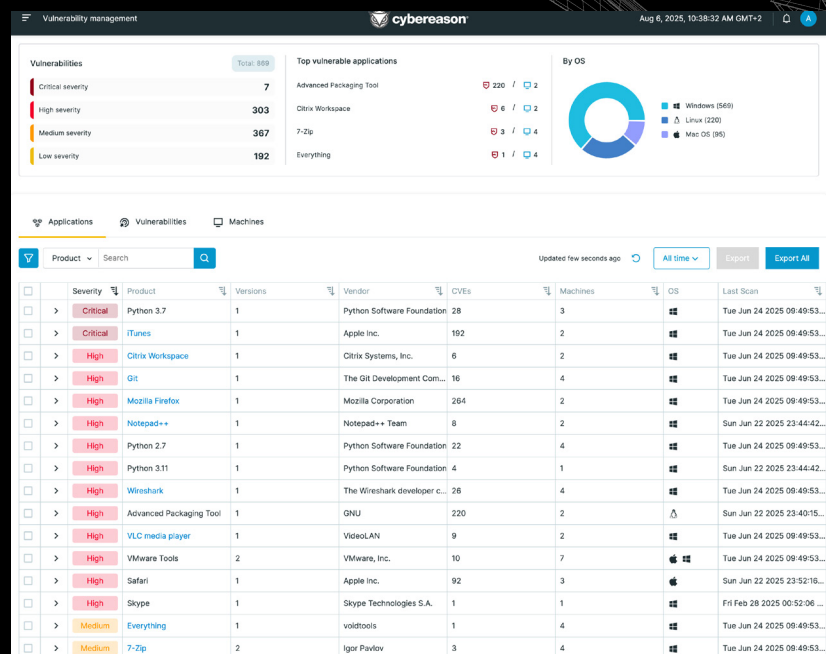

COMPREHENSIVE COVERAGE

20,000+
Vulnerability assessments for third-party applications

45,000+
Detects and analyzes CVEs

20+
Scans across major OS versions
